## Best keyboard for android 2019 download

Finding the perfect Android keyboard isn't an easy task - there's so much to choose from, and most of them are great, depending on the type of typist you are. This week, we're looking at five of the best, based on your nominations and votes. Earlier this week, we asked you to nominate your favorite Android keyboard for the top five, and vote to decide which one will make the final round. You responded with a lot more keyboards than we can emphasize here, but some definitely got above the lines. Here's what you said, in no particular order. One big thing about Android is that you can use any keyboard that suits your needs. Custom... Read more

SwiftKeySwiftKey has come a very long way even since the last time we asked for your favorite Android keyboards. At the time, his predictive text engine was his greatest strength - the fact that he was one of the first keyboards to actively learn from the way you typed and offer better suggestions for words and aye as a result. SwiftKey still does it really well, and if you turn it on (and it's optional), you can learn from your emails, social networks, text messages, and more to automatically fill in your friends' names, addresses, favorite words, and more. SwiftKey also supports multiple on-screen keyboard layouts, multiple keyboard sizes, phone and tablet-friendly layouts that you can move around the screen, topics and customization options, and cloud synchronization for your custom dictionary and saved text, so you don't start from scratch on a new device. Of course, it also supports typing gestures and slipping into type, including the space flow feature, which allows you to type entire sentences without lifting your finger. Also, did we mention that premium keyboard once is now free over on Google Play? Android: Last month, SwiftKey unveiled new custom keyboards that can be resized and re-placed... READ MORE

SwiftKey is not a stenger for Lifehacker or Lifehacker readers. You can see our previous coverage here, and those of you who appointed SwiftKey praised it for its features that were most useful to you. In some cases it was tablet-friendly layouts, with a split keyboard that made two hands easy with your thumbs. Others pointed out that its predictive text was the best in the category. Others praised SwiftKey for its themes and customization tools, all of which create a truly personalized experience. There's more where that came from, too. Read more in his nomination thread here. SwypeSwype had the original slide keyboard for type/typing gesture, and it still comes on a number of Android headphones by default. Over time, Swype has improved the skating engine to its type, improved its predictive text engine and added crowdsourced dictionaries, given users' customization options, and exported accents to Google Play, Dragon Sports dictation text-to-speech, thanks to its new parent company, Nuance. Now, Swype features split keyboard options and tablet-friendly layouts, great speech recognition, smooth typing, and easy language Android: Fans of Swype, one of our favorite Android keyboards, have a lot to be happy about... Read more

About those of you nominated for Swype praised its type skating feature, and 22 out of 1228, and Swype praised the skating feature for its kind, and 2016 aren't the same. Many of you have noted that Swype makes it easy to add punctuation, and copy and paste text by swiping keys. For many of you, Swype just hits the sweet spot, and while it's not perfect (many of you have reported slowness with it), it's fast, flexible, and offers more shortcuts and hotkeys than most other competitors. If you're interested, now that it's outside the beta you'll need to drop \$4 to get it on Google Play. Read more in his nomination thread here. Google KeyboardMake make no mistake, the default keyboard has come a long way in its own right. Google took some of the best features from third-party keyboards and rolled them into its own, which is available for free on Google Play. On the Google keyboard the stock (at least kit kat) has gesture typing, a learning dictionary that saves words you present to it, a built-in, custom text extension in text based on your typing habits, speech-to-text features, and more. It's incredibly powerful, offering free features, once only available on premium keyboards. It works as much on tablets as it does on phones, and while it doesn't abound with customization or customization options, or special features like I'm automatic capitalization or copy/paste shortcuts, it's solid enough that many people stick with it instead of dealing with another keyboard. Android: There have already been some pretty big text extension apps for Android. However, if... Read more

Fact, in the nominations thread, many of you have pointed out that there was a time when you couldn't wait to replace the default keyboard, but it got to be good enough now that there's no reason. The default keyboard is rich enough to feature and do the job, without slowing down your phone or tablet in the process. Many of you have pointed to the advanced features of Google Keyboards, which give them more control over your typing experience. At the same time, it only excels at devices running 4.0+, so if you're stuck with gingerbread or a tablet with honeycomb, the default keyboard may leave something desirable (though at least one of you has indicated you prefer keyboard 2.3 anyway.) you can read more in the nomination thread here. FleksyFleksy's minimalist on-screen look hides a ton of power under the hood. The real focus of the keyboard is on very high speed and accuracy. The standard QWERTY layout is fine and all that, but when the keyboard shines is that when you start typing, the keyboard layout changes to make sure that the letters you need are right there next to your finger. In fact, when it landed as a forestry app on iOS, we remarked that it was so good someone with poor vision could use it. Cheered when it arrived on Android, bringing its extraordinary Engine, invisible keyboards, automatic punctuation and multiple subjects throughout the trip. Once you have a sense of where to put your fingers, Fleksy allows you to type whole words and sentences without even looking at the keyboard, which is pretty impressive. One thing to note - Fleksy is designed for tap typing, not for people who like or are used to typing gestures. If it's you, it's definitely worth a shot. You can pick it up for \$4 on Google Play, or grab the first free version to get to know its features. iOS: Fleksy is an alternate keyboard with unprecedented predictive text skills. You can type... Those of you who appointed Pelsey praised its flagship feature primarily: it's an autocorrect engine. In fact, it's good enough to correct the word to the one you meant even if you typed every sign wrong, which is pretty impressive. Also, specify that you can customize the keyboard size and transparency to make it perfect for your needs. Of course, if you're used to predictive text or swipe to type, Fleksy's automatic corruption patch may or may not be enough to get you through, but it's still worth a try. Read more in the nomination thread here. Minuum KeyboardMinuum started life as an IndieGoGo project, and its users swept up and funded it, hoping to build a better Android keyboard. Her claim to fame is that it's tiny, but easy to use even if you have big fingers. We've highlighted it before, and again when he left Beta. The entire keyboard occupies a small ruler at the bottom of the screen, and is not in the way of your other work. Each QWERTY line shakes, and dosing relies heavily on text prediction to make typing easier and faster. While there is definitely a learning curve to use it, it helps if you are a thumb typewriter who likes to keep the screen clear and you just really need some space for the keyboard. If you're a big tap typist, or you like skating for type, it might not be the keyboard for you, but Minuum is still evolving. Android: Part of the problem with smartphones is that the virtual keyboards are all coming up with a read more from those of you who nominated it and praised its minimal interface, noting that while it takes some time to learn, it's worth it in the long run. Others of you weren't so sure, which is why I tried and you gave up, or you stuck to it because you believed in the idea. Either way, it has generated solid interest, and if you're interested in trying it, you can grab it for \$4 on Google Play, or pick up the free version to try out its features first. Read more in his nomination thread here. Now that you've seen the top five, it's time to vote for the beloved Lifehacker community: this week's honorable mention goes out to the Hodor keyboard. Because Hodor. Okay, beyond that, some other big keyboards just missed the cut. TouchPal X is a keyboard we've highlighted before, and was one of the first to have a full typing sentence gesture. It's radically customizable, allowing you to customize Layout and size, switch between 70+ languages and text inputs, and it supports predictive text. Its predictive text engine learns from SMS, Twitter account, contact names and other apps, similar to SwiftKey. If you're looking for a SwiftKey alternative that has a lot of the same features, TouchPal is worth a look. You can read some firm praise for it in her nomination wire here. Android/iOS: There is no shortage of paint-type keyboards available for Android, but TouchPal... Read more

Dextr is a non-QWERTY keyboard that is very popular with its users, and presents a unique and interesting approach to accelerating your mobile typing. The keys are divided in a way to make it easier for them to hit even with big fingers, and it's rolled up in predictive text and autocorrect that actually works well. For those of you who are used to or who prefer the standard QWERTY layout though, you'll need to climb the learning curve with it. Once you do - according to its users - you are in for pampering. Want to make the case your personal favorite, even if it's not included in the list? Remember, the top five nominees are based on your most popular nominations from the call for more early contenders this week. Don't just complain about the top five, let us know what your preferred alternative is - and make your case matter - in the discussions below. The Five Hive is based on reader nominations. Like most have five posts, if your favorite is left out, it hasn't received the required candidates in calling for contestants to post to make the top five. We understand this is a popularity contest. Do you have a suggestion for the hive five? Send us an e-tips+hivefive@lifehacker.com! tips+hivefive@lifehacker.com .
